

See risk. Avoid risk. Manage risk.

Periscopes' I.R.I.S (Integrated Risk management Information System) Software simplifies the complicated, time-consuming and costly risk management process. With its unique integration of risk governance within an organisation (up to six organisational levels), I.R.I.S ensures that, through normal business activity, everyone minimizes the risks. Using a simple to use but comprehensive task based calendar and checklist, I.R.I.S provides a secure and detailed audit trail that can be retrieved from an array of customisable reports. Risk governance has never been so extensive.

I.R.I.S Simplifies Risk Management

I.R.I.S enables organisations to simplify their risk management activities. It accurately quantifies risks based on risk settings, allowing management to effectively minimize risk impacts upon the organisation. With its in built risk description, classification, impact and action status system I.R.I.S allows the linking of both risk information and actions directly to a hierarchy of project tasks. This process of linking risks and actions to tasks prevents overwhelming employees with information, keeping the risk information specific to the task in hand, saving both time and money.

I.R.I.S provides each employee with their own task based calendar. The Calendar organises work flow, sends email alerts within the organisations hierarchy, provides links to specific task related documentation, enables a task feedback facility and provides the important task sign off protocols.

I.R.I.S for Audit and Reports

All of I.R.I.S' functionality is built upon a stable SQL database. The database records and retains all project information and activities providing a comprehensive audit trail. I.R.I.S has been designed to provide a large number of reports of varying complexity. From task alert reports right through to detailed board reporting and corporate knowledge reports, I.R.I.S can quickly provide meaningful information within minutes – a process that usually would take hours if not days to compile. And if I.R.I.S doesn't have the report you want the team at Periscope can create new reports or modify existing reports to suit the needs of Board Members, Managers, Users and Auditors.

Accessing I.R.I.S

I.R.I.S makes the most of the Internet's most valuable feature, access. When running I.R.I.S from Periscopes' Hosting Service employees, using Internet Explorer 5.5 and above, can securely access the system from anywhere the internet is available. Using 128 bit encryption, and MD5# personal authentication, Periscope provides a high level of security and information integrity.

I.R.I.S Adaptability

Any organisation that wants to prevent any kind of risk will find the software is of great value, particularly those that need to demonstrate governance of those risks. The unique flexibility of I.R.I.S allows the management of risks in such diverse areas as:

- environment
- finance
- occupational health and safety
- marketing
- and of course technological

Interestingly, customers also use I.R.I.S as a project management tool to implement MS Project outcomes and to record and manage audit findings. The new survey module provides the added opportunity to create on line forms, such as Incident reporting, ideas capture and On-line job applications.

Using I.R.I.S

Well we keep saying it is easy to use so we thought we should clarify what you need to know to use the software.

Employee user – A basic understanding of how to use an internet browser and using computer based calendar similar to MS Outlook would be an advantage.

Manager user – An understanding of risk exposure at an operational level, an understanding of the organisation hierarchy as well as a basic understanding of data entry. A basic knowledge of project management software, similar to MS Project would be an advantage.

Administrator user – An understanding of Project management software similar to MS Project and experience in databases similar to MS Access. Knowledge of risk governance and reporting would be an advantage.

I.R.I.S Benefits

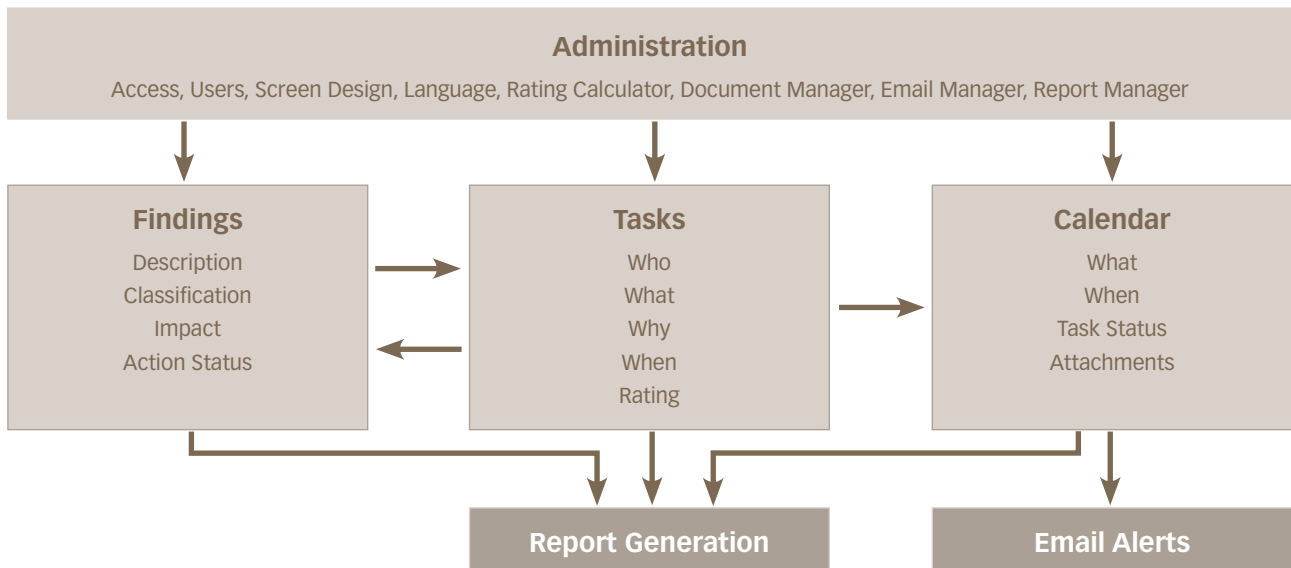

- a fully client customisable system including security access, screen design and reporting.
- support for AS4360:2004 Risk Management, ISO 14001 Environmental Management.
- a truly web enabled system that provides full Internet functionality, from dial up access through to broad band connections.
- cost effective risk management through of simple use and self contained design.
- integrates fully into your organisation, preserving corporate culture, work methods and language—the entire system can be configured by the administrator to be in another language.
- an intelligent user specific task calendar incorporating email alerts for due and overdue tasks.
- ability to link risk management documentation to the relevant task(s).
- powerful search engine to filter information on activity and site based document management on screen or for reports.
- retention of corporate knowledge.
- accurate benchmarking.
- Full software support and ongoing development.
- Ability to share experiences, processes, and software updates with like minded organisations.

I.R.I.S the choice adopted by:

- Water utility companies
- Power utility companies
- Gas utility companies
- Postal logistics
- Government Departments
